

How do I Clean Tile

For general cleaning of ceramic or porcelain tile..

We recommend using a pH neutral cleaner. These cleaners are safe on any water-safe surface and leave no residue behind. A good example is AquaMix concentrated tile cleaner

For wall applications...

We recommend using the cleaner in a spray bottle. To get started, shake the bottle of cleaner well and spray it onto the tile area. Scrub the area with a brush or special pad call a doodlebug. Finish up by rinsing the area clean.

When cleaning floors...

Make sure you damp mop. Most people make the mistake of using too much water which just pushes dirt from one area to another.

For harder to clean ceramic or porcelain surfaces

We recommend using a more stringent cleaner such as Nano Scrub. This overview covers the more general, safer types of cleaners. For more stringent cleaning we recommend you consult an expert.
